

Bioinformatics: A perspective

Dr. Matthew L. Settles

Genome Center
University of California, Davis
settles@ucdavis.edu

Outline

- The World we are presented with
- Advances in DNA Sequencing
- Bioinformatics as Data Science
- Viewport into bioinformatics
- Training
- Suggestions
- An introduction to the Core

Sequencing Costs

Cost per Megabase of Sequence

Cost per Human Sized Genome @ 30x

- Includes: labor, administration, management, utilities, reagents, consumables, instruments (amortized over 3 years), informatics related to sequence productions, submission, indirect costs.
- <http://www.genome.gov/sequencingcosts/>

Growth in Public Sequence Database

- <http://www.ncbi.nlm.nih.gov/genbank/statistics>

Short Read Archive (SRA)

Growth of the Sequence Read Archive (SRA) over time

<http://www.ncbi.nlm.nih.gov/Traces/sra/>

Increase in Genome Sequencing Projects

Lists > 3700 unique genus

- JGI – Genomes Online Database (GOLD)
- 67,822 genome sequencing projects

Sequencing Platforms

- 1986 - Dye terminator Sanger sequencing, technology dominated until 2005 until “next generation sequencers”, peaking at about 900kb/day

'Next' Generation

- 2005 – 'Next Generation Sequencing' as Massively parallel sequencing, both throughput and speed advances. The first was the Genome Sequencer (GS) instrument developed by 454 life Sciences (later acquired by Roche), Pyrosequencing 1.5Gb/day

Discontinued

Illumina

- 2006 – The second ‘Next Generation Sequencing’ platform was Solexa (later acquired by Illumina). Now the dominant platform with 75% market share of sequencer and and estimated >90% of all bases sequenced are from an Illumina machine, Sequencing by Synthesis > 200Gb/day.

Complete Genomics

- 2006 – Using DNA nanoball sequencing, has been a leader in Human genome resequencing, having sequenced over 20,000 genomes to date. In 2013 purchased by BGI and is now set to release their first commercial sequencer, the Revolocity. Throughput on par with HiSeq

NOW DEFUNCT

Human genome/exomes only.

10,000 Human Genomes per year

Bench top Sequencers

- Roche 454 Junior
- Life Technologies
 - Ion Torrent
 - Ion Proton
- Illumina MiSeq

The 'Next Next' Generation

- 2009 – Single Molecule Read Time sequencing by Pacific Biosystems, most successful third generation sequencing platforms, ~2Gb/day, New Pac Bio Sequel ~14Gb/day.

Oxford Nanopore

- 2015 – Another 3rd generation sequencer, founded in 2005 and currently in beta testing. The sequencer uses nanopore technology developed in the 90's to sequence single molecules. Throughput is about 500Mb per flowcell.

**Fun to play with but
results are highly
variable**

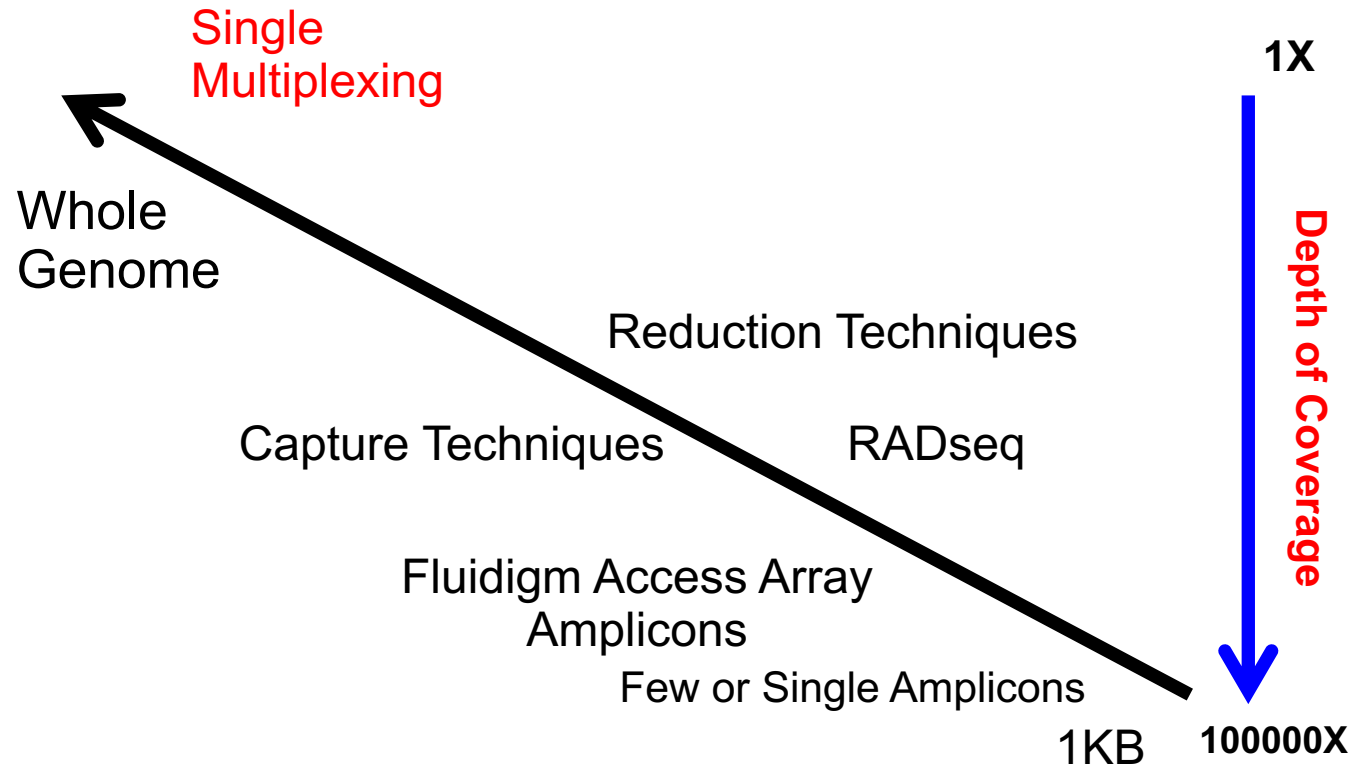

FYI: 4th generation sequencing is being described as In-situ sequencing

Flexibility

Genomic reduction allows for greater coverage and multiplexing of samples.

You can fine tune your depth of coverage needs and sample size with the reduction technique

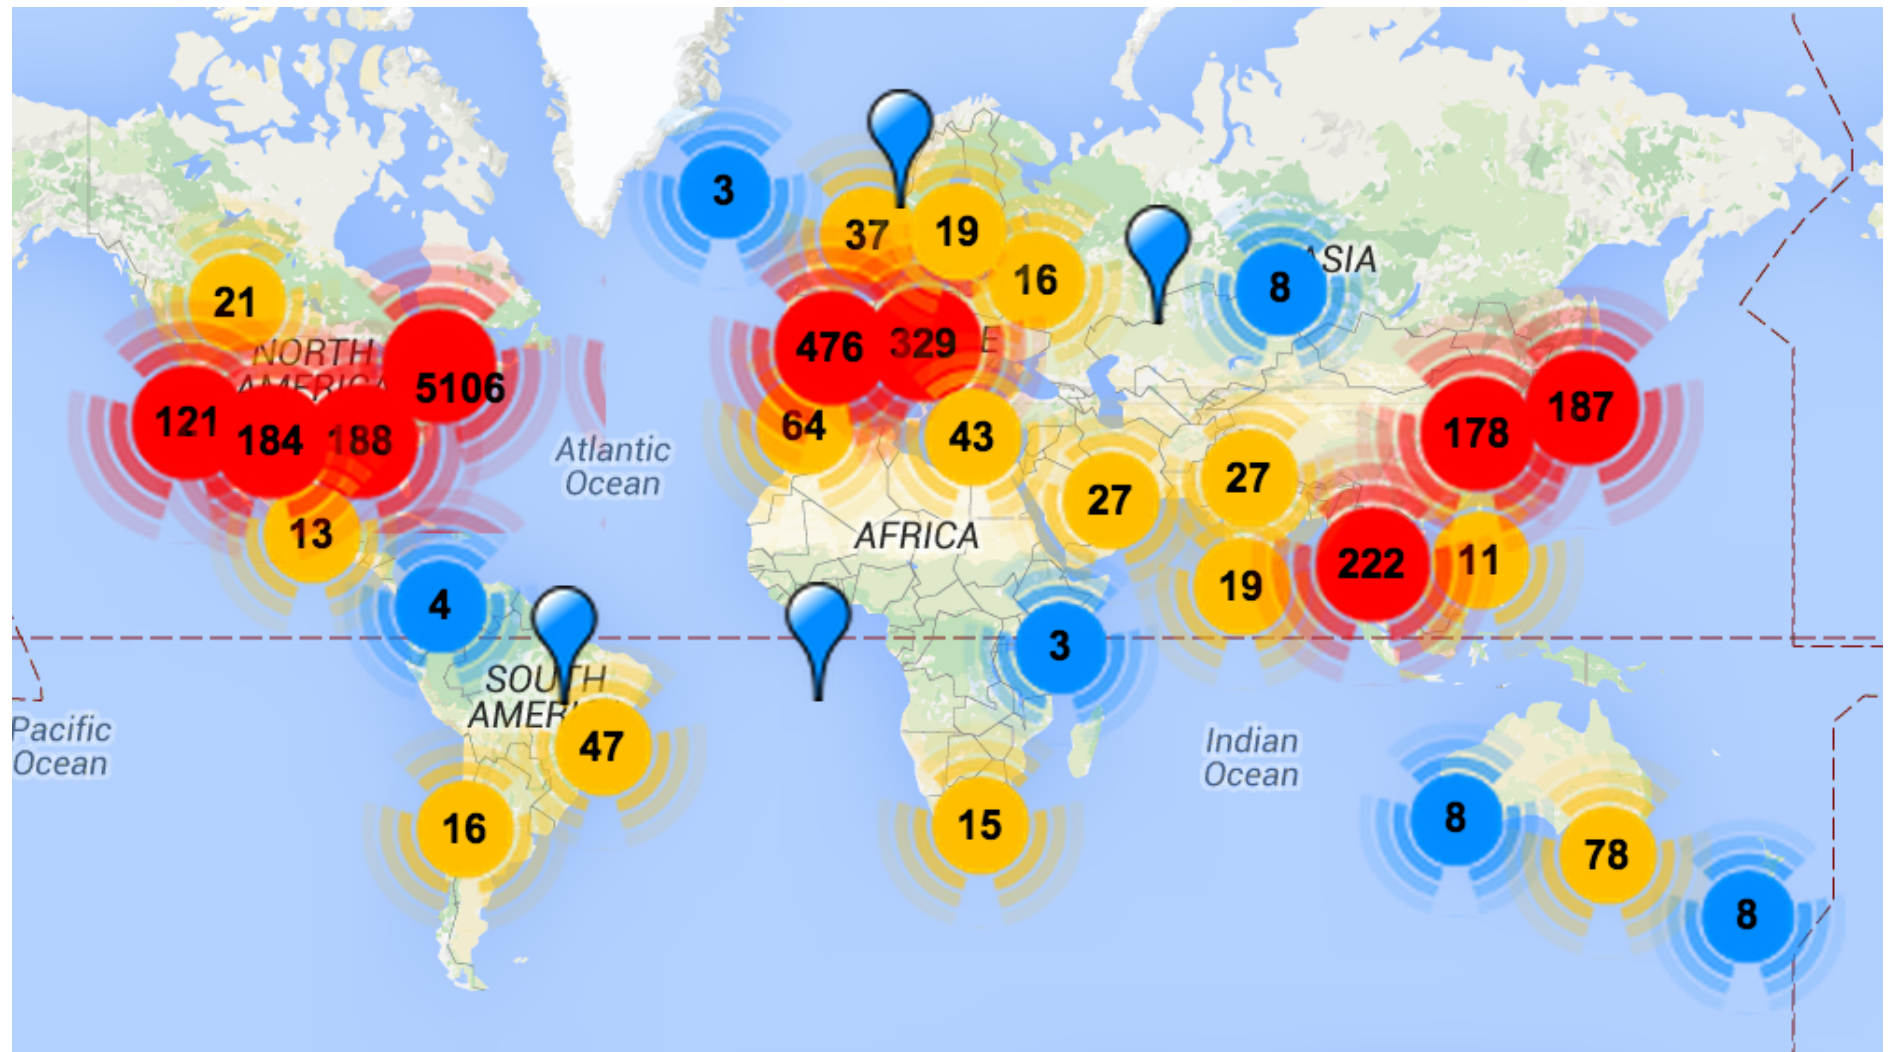

Greater Multiplexing

Sequencing Libraries

• DNA-seq	DNase-seq	tagRNA-seq
• RNA-seq	ATAC-seq	PAT-seq
• Amplicons	MNase-seq	Structure-seq
• ChIP-seq	FAIRE-seq	MPE-seq
• MeDiP-seq	Ribose-seq	STARR-seq
• RAD-seq	smRNA-seq	Mod-seq
• ddRAD-seq	mRNA-seq	BrAD-seq
• Pool-seq	Tn-seq	SLAF-seq
• EnD-seq	QTL-seq	G&T-seq

The data deluge

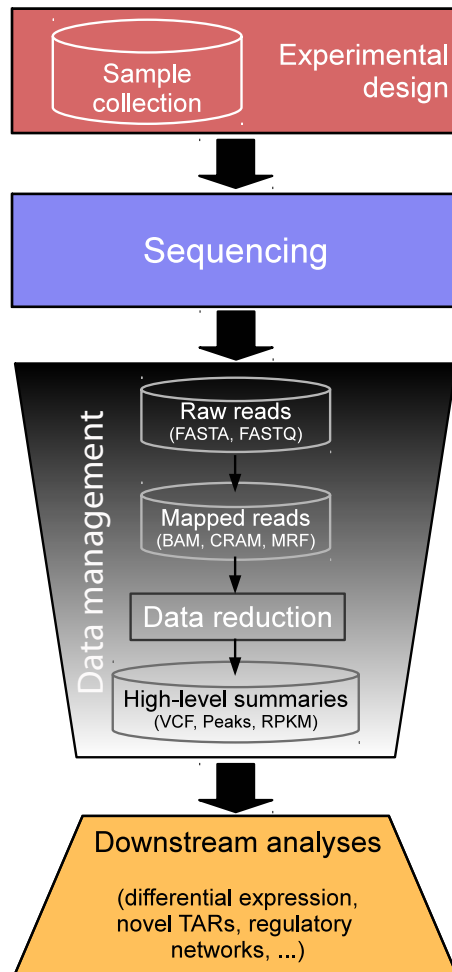

- Plucking the biology from the Noise

Reality

- Its much more difficult than we may first think

The real cost of sequencing

Bioinformatics is Data Science

Computational Biology

Biostatistics

Bioinformatics

‘The data scientist role has been described as “part analyst, part artist.”’
Anjul Bhambhri, vice president of big data products at IBM

Data Science

Data science is the process of formulating a quantitative question that can be answered with data, collecting and cleaning the data, analyzing the data, and communicating the answer to the question to a relevant audience.

7 Stages to Data Science

1. Define the question of interest
2. Get the data
3. Clean the data
4. Explore the data
5. Fit statistical models
6. Communicate the results
7. Make your analysis reproducible

1. Define the question of interest

Begin with the end in mind!

what is the question

how are we to know we are successful

what are our expectations

dictates

the data that should be collected

the features being analyzed

which algorithms should be use

2. Get the data
3. Clean the data
4. Explore the data

Know your data!

know what the source was
technical processing in producing
data (bias, artifacts, etc.)
“Data Profiling”

Data are never perfect but love your data anyway!

the collection of massive data sets often leads to unusual ,
surprising, unexpected and even outrageous.

5. Fit statistical models

Over fitting is a sin against data science!

Model's should not be over-complicated

- If the data scientist has done their job correctly the statistical models don't need to be incredibly complicated to identify important relationships
- In fact, if a complicated statistical model seems necessary, it often means that you don't have the right data to answer the question you really want to answer.

6. Communicate the results
7. Make your analysis reproducible

Remember that this is 'science'!

We are experimenting with data selections, processing, algorithms, ensembles of algorithms, measurements, models. At some point these ***must all be tested for validity and applicability*** to the problem you are trying to solve.

**Data science done well looks easy
– and that's a big problem for data
scientists**

Training: Data Science Bias

Data Science (data analysis, bioinformatics) is most often taught through an apprentice model

Different disciplines/regions develop their own subcultures, and decisions are based on cultural conventions rather than empirical evidence.

- Programming languages
- Statistical models (Bayes vs Frequentist)
- Multiple testing correction
- Application choice, etc.

These (and others) decisions matter **a lot** in data analysis

"I saw it in a widely-cited paper in journal XX from my field"

The Data Science in Bioinformatics

Bioinformatics is not something you are taught,
it's a way of life

*“The best bioinformaticians I know are **problem solvers** – they start the day not knowing something, and they enjoy finding out (themselves) how to do it. It’s a great skill to have, but for most, it’s not even a skill – it’s a passion, it’s a way of life, it’s a thrill. It’s what these people would do at the weekend (if their families let them).”*

Mick Watson – Rosland Institute

Models

- Workshops
 - Often enrolled too late
- Collaborations
 - More experience persons
- Apprenticeships
 - Previous lab personnel to young personnel
- Formal Education
 - Most programs are Post-doc or graduate level
 - Few Undergraduate

Substrate

Cloud
Computing

Cluster
Computing

BAS™

LINUX

Laptop & Desktop

Environment

“Command Line” and “Programming Languages”

VS

Bioinformatics Software Suite

Bioinformatics

- Know and Understand the experiment
 - “The Question of Interest”
- Build a set of assumptions/expectations
 - Mix of technical and biological
 - Spend your time testing your assumptions/expectations
 - Don’t spend your time finding the “best” software
- Don’t under-estimate the time Bioinformatics may take
- Be prepared to accept ‘failed’ experiments

Bottom Line

The Bottom Line:

Spend the time (and money) planning and producing **good quality, accurate and sufficient data** for your experiment.

Get to know to your data, develop and test expectations

Result, you'll **spend much less time** (and less money) extracting biological significance and results during analysis.

The **mission** of the Bioinformatics Core facility is to facilitate outstanding omics- scale research through these activities:

Data Analysis

The Bioinformatics Core promotes experimental design, advanced computation and informatics analysis of omics scale datasets that drives research forward.

Research Computing

Maintain and make available high-performance computing hardware and software necessary for todays data-intensive bioinformatic analyses.

Training

The Core helps to educate the next generation of bioinformaticians through highly acclaimed training workshops, seminars and through direct participation in research activities.

-omics is “Collaborative Research”

- Today's experiments are complex and getting more complex
- Know one person, or even one group typically has the needed capabilities in all areas
- M

Prerequisites

- Access to a multi-core (24 cpu or greater), 'high' memory 64Gb or greater Linux server.
- Familiarity with the 'command line' and at least one programming language.
- Basic knowledge of how to install software
- Basic knowledge of R (or equivalent) and statistical programming
- Basic knowledge of Statistics and model building
